

Schriftenreihe der Zementindustrie, Heft 77: Assessing the autogenous shrinkage cracking propensity of concrete by means of the restrained ring test

Filesize: 2.15 MB

Reviews

The book is straightforward in read through better to recognize. it absolutely was writtern quite completely and valuable. Its been printed in an exceptionally simple way which is only after i finished reading this book where really altered me, alter the way i believe.

(Kenyatta Berge DDS)

SCHRIFTENREIHE DER ZEMENTINDUSTRIE, HEFT 77: ASSESSING THE AUTOGENOUS SHRINKAGE CRACKING PROPENSITY OF CONCRETE BY MEANS OF THE RESTRAINED RING TEST

To get **Schriftenreihe der Zementindustrie, Heft 77: Assessing the autogenous shrinkage cracking propensity of concrete by means of the restrained ring test** PDF, remember to access the web link under and download the document or gain access to other information which are in conjunction with **SCHRIFTENREIHE DER ZEMENTINDUSTRIE, HEFT 77: ASSESSING THE AUTOGENOUS SHRINKAGE CRACKING PROPENSITY OF CONCRETE BY MEANS OF THE RESTRAINED RING TEST** ebook.

Verlag Bau & Technik Sep 2011, 2011. Buch. Book Condition: Neu. 21x14.8x cm. Neuware - Autogenous shrinkage is the major shrinkage component of concretes that contain much less water than would be required for complete hydration. This mainly applies to ultra-high strength concrete and, to a lesser extent, to high strength concrete. Both have particularly low water-cement ratios. The relative surplus of cement leads to an internal drying, irrespective of whether the concrete dries out to the ambient air or not. This process of so called selfdesiccation is associated with autogenous shrinkage which, if restrained, can lead to cracks, potentially impairing the in many respects outstanding durability of these kinds of concrete. Hence, to fully benefit from the advantages of high and ultra-high strength concrete, it is essential to minimize the risk of autogenous shrinkage cracking. Attempts to do so, however, require a reliable method for assessing this risk. Presently, there is no such method. Cracks are the result of relatively complex processes, in particular at early age as concrete properties change rapidly. A dependable assessment of the cracking risk requires comprehensive testing and a thorough understanding of the interacting parameters. Early age cracking in cementitious systems is not a new problem; cracking due to restrained drying shrinkage and thermal contraction has been examined at length. However, the investigation and prediction of stresses and cracks due to autogenous shrinkage brings about new challenges. The essential issue is the onset of stresses at very early age. This greatly increases the influence of creep and relaxation. Especially at stress levels close to failure this influence is highly non-linear and difficult to quantify, experimentally as well as mathematically. Another challenge is the fact that temperature strongly influences the autogenous shrinkage and, presumably, the cracking risk as well. From isothermal tests at different temperatures...
