RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 38 pages. Original publisher: Huntsville, AL : Lockheed Missiles and Space Company, Inc. , Huntsville Engineering Center ; Marshall Space Flight Center, AL : National Aeronautics and Space Administration, 1988 OCLC Number: (OCoLC)320429045 Excerpt: . . . LHSC-HEC TR F225800 Periodic boundary conditions are applied at the lateral boundaries to simulate the effect of a row of struts, such as exists in the HGM. The posts, which are located midway between successive struts ( Fig. 2b ) are treated as no-slip boundary nodes. To date, the posts have been included in two-dimensional laminar calculations only. For the two-dimensional computations uniform static For the pressure and velocity is assumed and held fixed at the inlet. known three-dimensional calculation of a strut in an annulus, a uniform static pressure is held fixed at the inlet. The velocity profile at the inlet is also held constant, with the velocity magnitudes being derived from a power law formulation in the vicinity of the inner and outer no-slip surfaces. 2. 5 TURBULENCE MODEL 6 ) A Baldwin-Lomax turbulence model ( Ref. was used to parameterize the turbulent shear stresses for the two-dimensional flow around a strut. In this approach, an eddy viscosity ) (  $\mu$  is calculated for an inner and an outer  $t$  region. The eddy viscosity for the inner region is based on the Prandtl-Van Driest formulation 2 ( 2 )  $I W I P a ( t$  inner where and is the wall shear stress. The magnitude the vorticity is  $i w l T$  of  $W$  given by The eddy viscosity for the outer region is given by-( 5 ) (  $t$  )  $c p F w a k e F k l e b - o u t e r n L I$  where  $F$  is the smaller of  $Y F$  Or  $w a k e m a x . . .$
